## OUTPUT:

The screenshot shows the IBM Watson IoT Platform interface. At the top, there are tabs for 'Browse', 'Action', 'Device Types', and 'Interfaces'. A blue header bar contains the device name 'DISTANCEDETECT', its status 'Disconnected', type 'ULTRASON', and location 'Device'. Below this, there are tabs for 'Identity', 'Device Information', 'Recent Events' (which is selected), 'State', and 'Logs'. A table titled 'Recent Events' displays a stream of data. The table has four columns: 'Event', 'Value', 'Format', and 'Last Received'. The data shows five 'Data' events, each with a value of '{\"distance\":141.21,\"object\":\"No\"}' in 'json' format, received 'a few seconds ago'. At the bottom, there is a pagination bar showing 'Items per page 50' and '1-2 of 2 items'.

Event	Value	Format	Last Received
Data	{\"distance\":141.21,\"object\":\"No\"}	json	a few seconds ago
Data	{\"distance\":141.21,\"object\":\"No\"}	json	a few seconds ago
Data	{\"distance\":141.21,\"object\":\"No\"}	json	a few seconds ago
Data	{\"distance\":141.18,\"object\":\"No\"}	json	a few seconds ago
Data	{\"distance\":141.2,\"object\":\"No\"}	json	a few seconds ago

Data send to the IBM Cloud Device when the object is far

The screenshot shows an Arduino IDE with a code file named 'esp32-blink.ino'. The code is for an ESP32 microcontroller connected to an HC-SR04 ultrasonic sensor. It includes the necessary libraries for WiFi and MQTT, and defines the device type as 'ULTRASON' and the device ID as 'DISTANCEDETECT'. The code sets up a WiFi client and an MQTT client, and defines a callback function to handle incoming data. The main loop sends a payload to the MQTT broker every 10 seconds. The simulation window on the right shows the sensor's output, indicating that the object is 'No' and the distance is 141.21 cm.
